

## Updating D\*AP8 MAP with Serial Numbers 7120800100...7120800125

For devices with these serial numbers there are some additional actions necessary.

After installing the current firmware (included in this package) some features may not be available caused by a wrong license setup. Therefore it is necessary to apply a new license file to devices in this serial number range. License files are included in this software package.

There is a license file for every single serial number. The correct file can be identified by its file name that includes the serial number (e.g. licensefile-7120800112-b8x(map).xml).

Further it is necessary to check the correct firmware version of the Dolby Decoder (CAT1100). It has to be “1.6.0.6” – if it has a lower number, it is needs to be updated. The appropriate file is included in this package.

**Updating the firmware is a delicate process - please be careful.**

**Under NO circumstances should the power supply be unplugged or switched off during the updating process.**
